

Helios House

Solarsense Zero Carbon Office

The new Helios House building plays a part in the overall aim to transform the Solarsense head office into a regional centre of excellence for clean energy.

The state-of-the-art building was designed to generate more energy than it consumes and boasts an extensive array of fully integrated photovoltaic panels, solar PV roof lights, LED lighting, air source heat pump & electric vehicle charge-points.

By practising what they preach, Solarsense has invested in a showcase building that utilises the latest renewable energy technology available for all homes and offices. The building provides an engaging environment for members of the public, businesses, architects and consultants to see how easy it is to incorporate renewables. Solarsense hold a number of seminars, open days and workshops on renewable technologies and energy efficiency to benefit the local community. The exemplary project was accepted for a West of England Regional Growth fund and offers both an inspiring work environment and engaging real life case study for those considering switching to clean energy technologies.
