

Clark's Village

Street, Somerset South UK

Technology: Solar PV

System size: 80kWp

Annual output: 71,500kWh

Annual CO2 savings: 37.8 tonnes

As with many commercial solar installations the Clarks Village system needs to perform in terms of generation and also from a visual and environmental perspective.

With more than four million annual visitors the system is a clear demonstration of the retail centre's environmental commitment.

By specifying Innotech solar modules, Solarsense were able to provide a system that met all of the client's needs.

With energy bill savings and FiT income combined, the first year value of the system to the business is more that £15,000. With RPI index linked income over 20 years the system is predicted to give a 19% ROI and payback in under six years.
